

There are many ways to learn, there are the three obvious ways that everyone knows about, auditory, visual, and tactical. After taking the quiz the results showed I was nearly 50/50 visual and tactical. To be specific, I was 50% tactical, 40% visual, and only 10% auditory. I learn through working hands on, or seeing something done. I can't just hear something like instructions and then be able to do it. For example, I learn how to play board/card games through just watching a round, rather than reading or having the instructions read to me. Bottom line though, there is no "right" way to learn. It is entirely dependent on the person. I don't know what really causes it, but some people are just naturally better listeners, and some people just do better with hands-on learning. Not to say people can't improve on their weaker learning styles, but usually they just practice at what they already excel at. It's a very general outlook on learning I believe. I think the only differences between the learning styles are the obvious ones, visual learners obviously want visuals, auditory, audio, exedra. I believe the only main effect on how different learners learn is the way they consume knowledge. Whether it's visual, through hands on work, or audio.
